

An increased level of security

with a reduction of overall costs

Background

Clearway Services worked alongside a new client, Wilson James, a multi-disciplinary security services provider, responsible for security at Associated British Ports, the UK's leading ports group. The port in question was Goole in Yorkshire, where Wilson James provided security in the form of on-site staff. However the client wanted an extra level of security without the associated costs and increased risks of more manual 'guarding hours'.

Solution

Following a full site survey an inView CCTV tower was rapidly deployed and installed along with associated detectors to provide coverage over a large area. The tower arrived equipped with solar power capability, and was able to recharge its own sealed batteries during daylight hours via its solar panels. Port security now also benefits from remote monitoring provided by our NSI Gold II Alarm Receiving Centre (ARC) for 24/7 protection of assets.

"Needless to say, I'm impressed by how responsive Clearway's service was and their engineers who managed the tower deployment very professionally to deliver a swift and hassle-free security solution to site. Operationally this ensured we could continue to deliver an excellent client service while maintaining our security officers' efficiency and, more importantly, safety, thereby allowing them to manage other more critical areas."

Don McCann, Wilson James

Key Services

-  Site survey
-  inView CCTV tower
-  Remote monitoring

Outcome

Any movement is now detected by one or more of the sensors, which the powerful camera then homes in on using its pan, tilt and zoom capabilities. Images or video clips captured by the camera are relayed to Clearway's central control team, who then alert the Wilson James' on-site team to investigate. This combination of technology and people has led to a significant reduction in 'guarding hours' and costs, whilst increasing levels of security.

Clearway delivered and installed the tower and sensors, carried out a full site survey, system setup and connection to its control centre within 24 hours.
